Android App
Project 2: Milestone 1

Description of your app including your app's inspiration and goal.

My app is a thankfulness app that allows the user to record one thing that they are thankful for each day. The user will tap on the day of the month that he/she wishes to record his/her thought & then save that thankful moment. On the calendar screen the app will load a random previously saved thought on the bottom of the screen using the icon the user chose and the color for the background.

Define your app's intended audience. Who will be using your app? What problem is your app solving for them?

My app's intended audience is for anyone who would like to think positive & record something that they are thankful for each day.

Do some research -- do similar apps exist?

Yes, there are some similar apps, but they are set up a little differently.

Where will you get any content needed for your app? This could include text, formulas, whatever your app requires.

I will design the color scheme for the app as well as the icons. I found several tutorials on working with Calendar View on Android. I'm not sure what method I will use for data persistence yet.

Include a digital version of your paper prototype (next page)
